GLAB 404 4 1 DAX homework

Step 1: Importing Sales Data

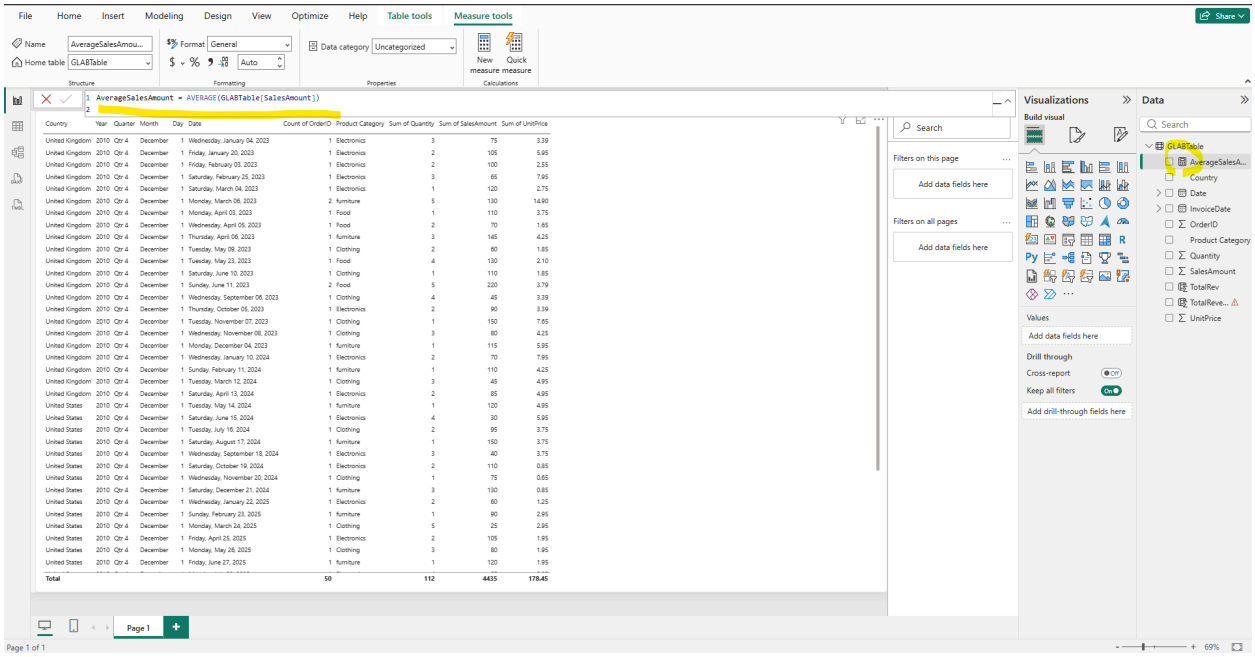

I imported the Excel sales data into Power BI. The data is now ready to use for DAX calculations.

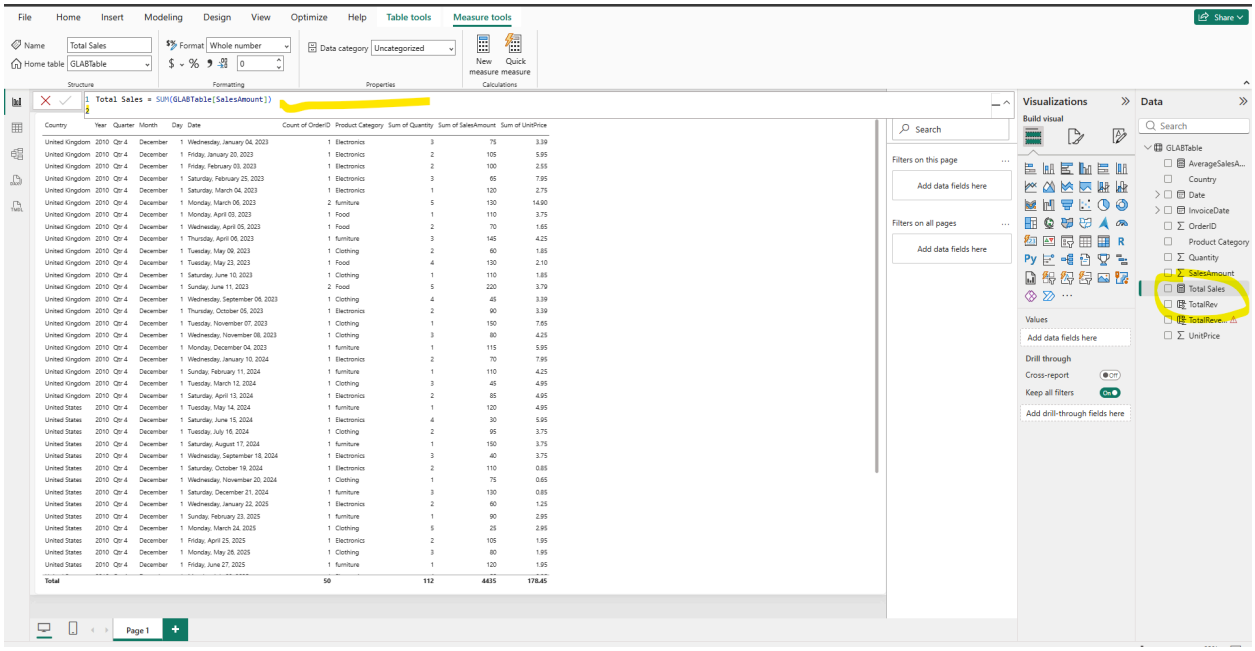

I created the TotalRevenue column by multiplying SalesAmount by Quantity using DAX.

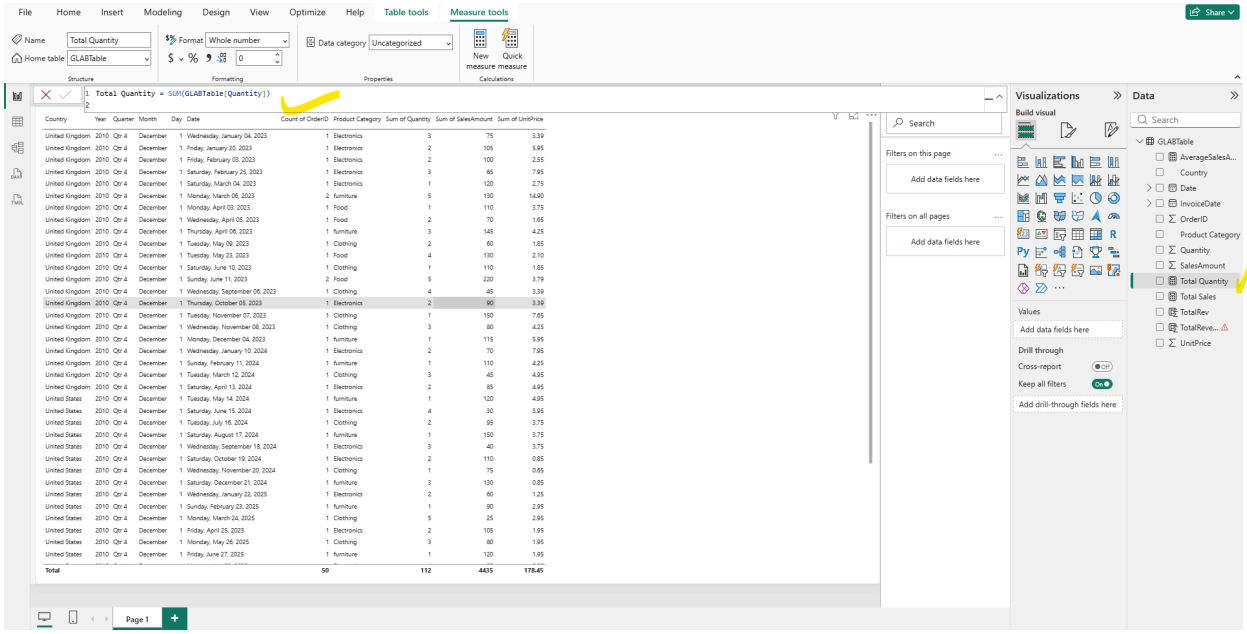

I created a measure using the AVERAGE function to calculate the average sales amount. (calculator icon)

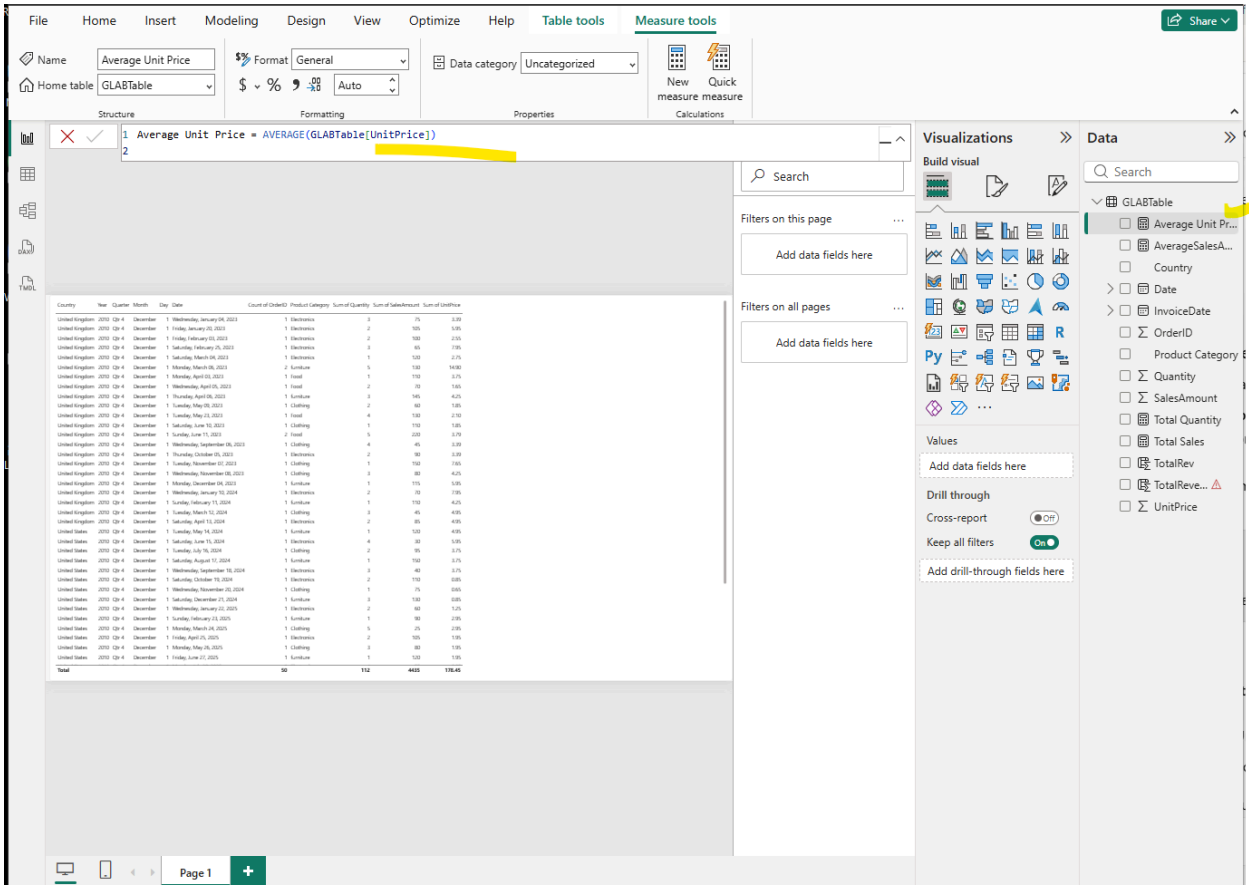

I used the SUM function to calculate the total sales amount from the dataset.

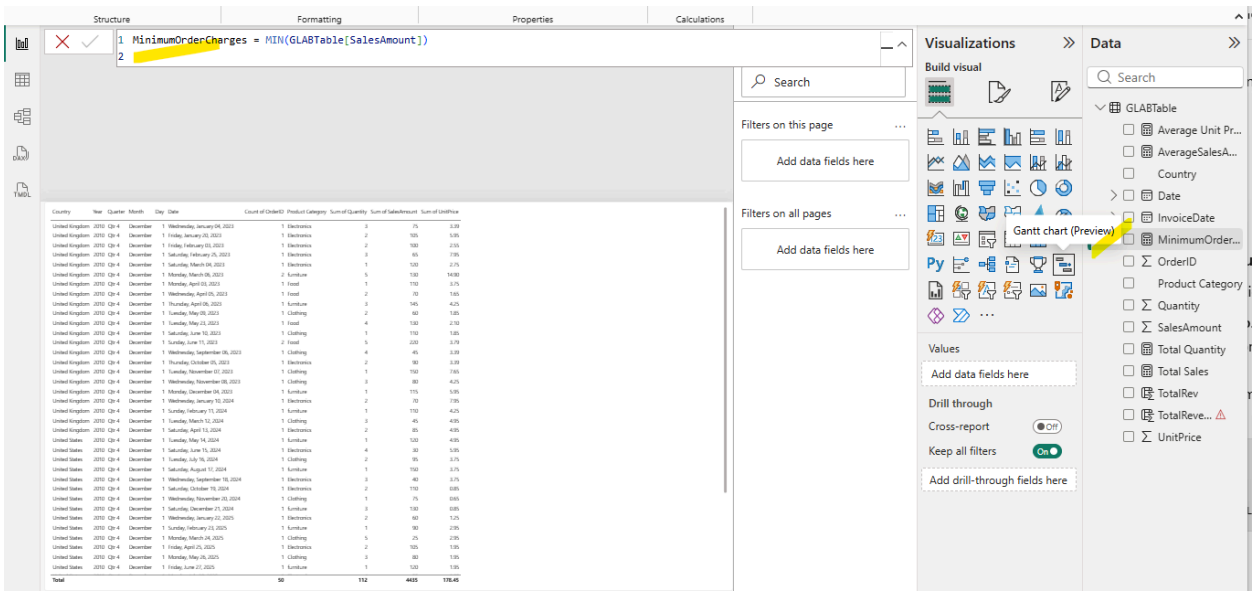

I used the SUM function to calculate the total quantity of products sold.

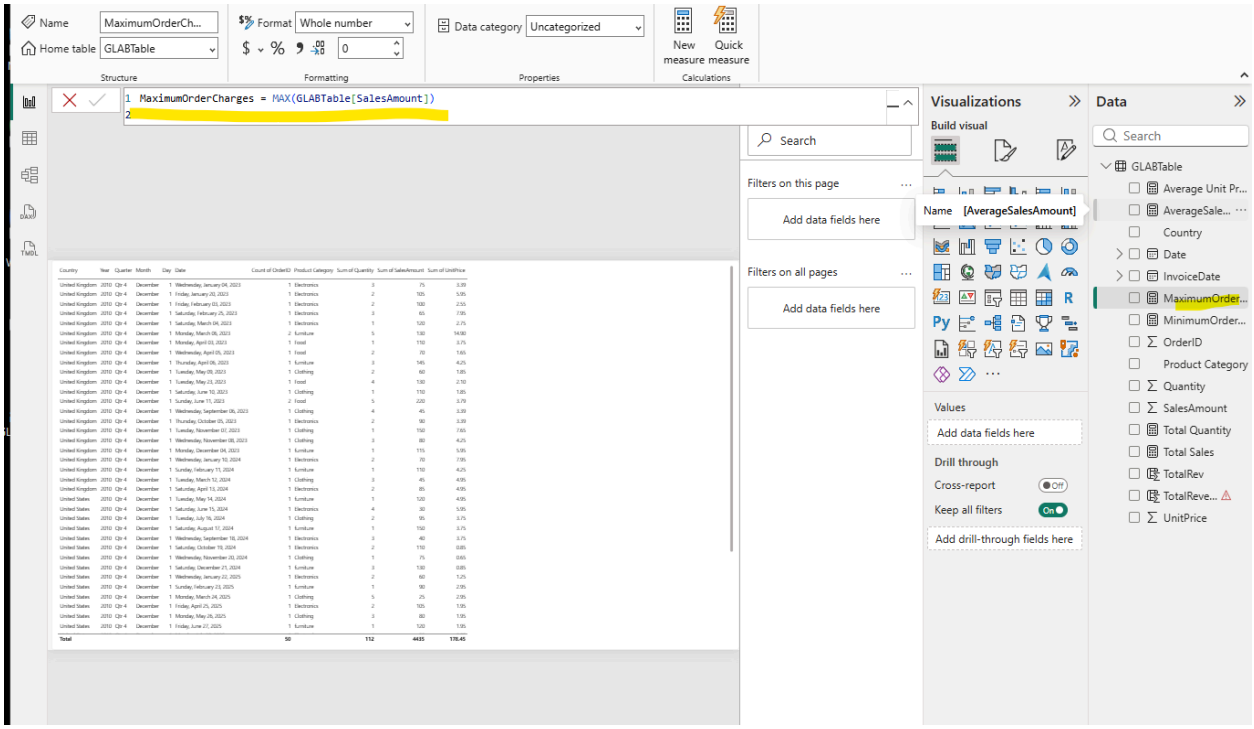

I used the AVERAGE function to find the average unit price of the products.

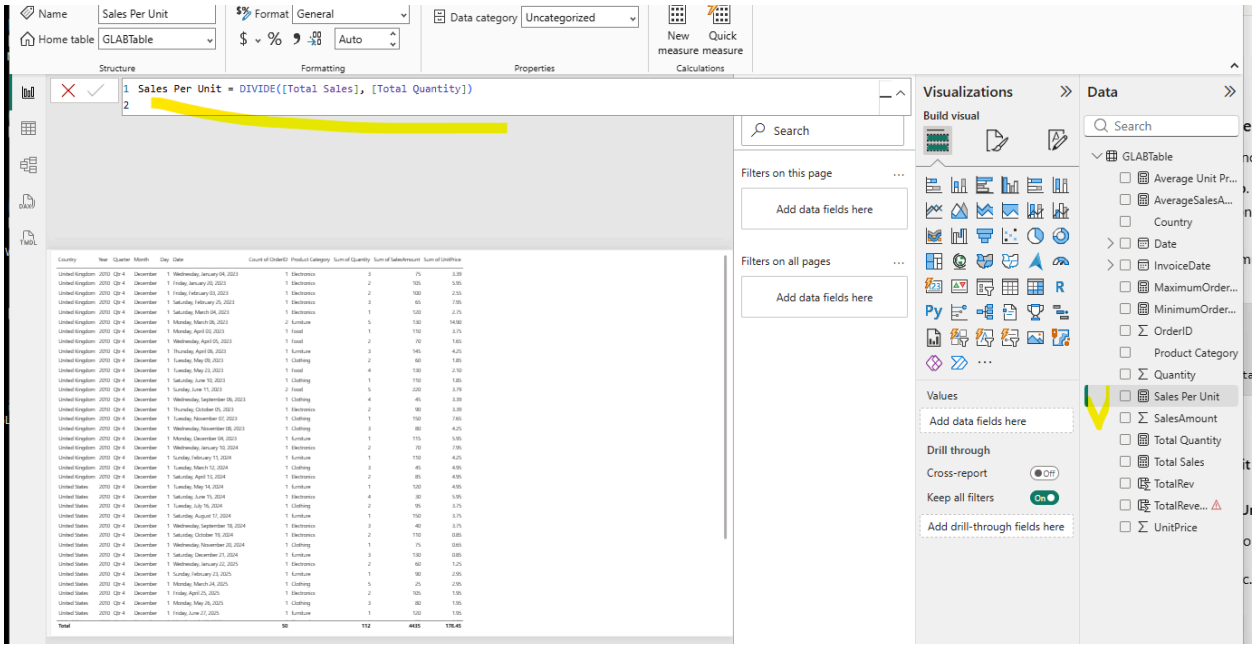

I used the MIN function to find the lowest sales amount in the dataset.

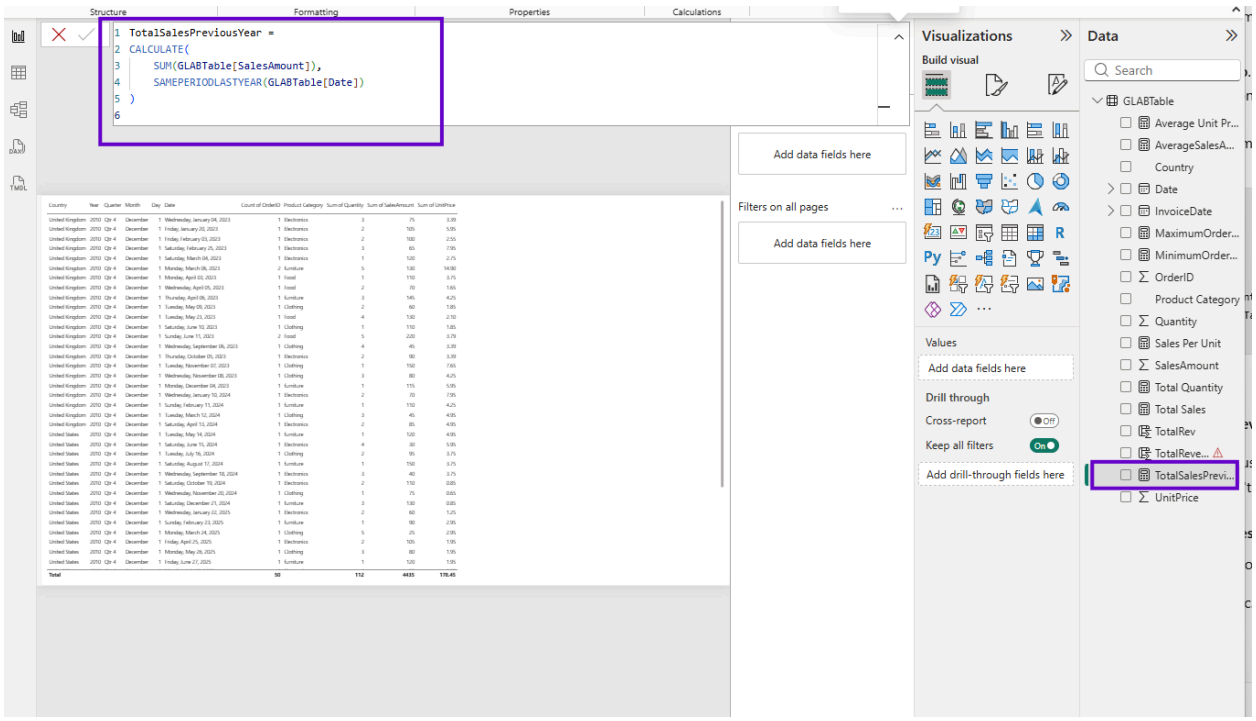

I used the MAX function to find the highest sales amount in the dataset.

I used the DIVIDE function to calculate sales per unit by dividing total sales by total quantity.

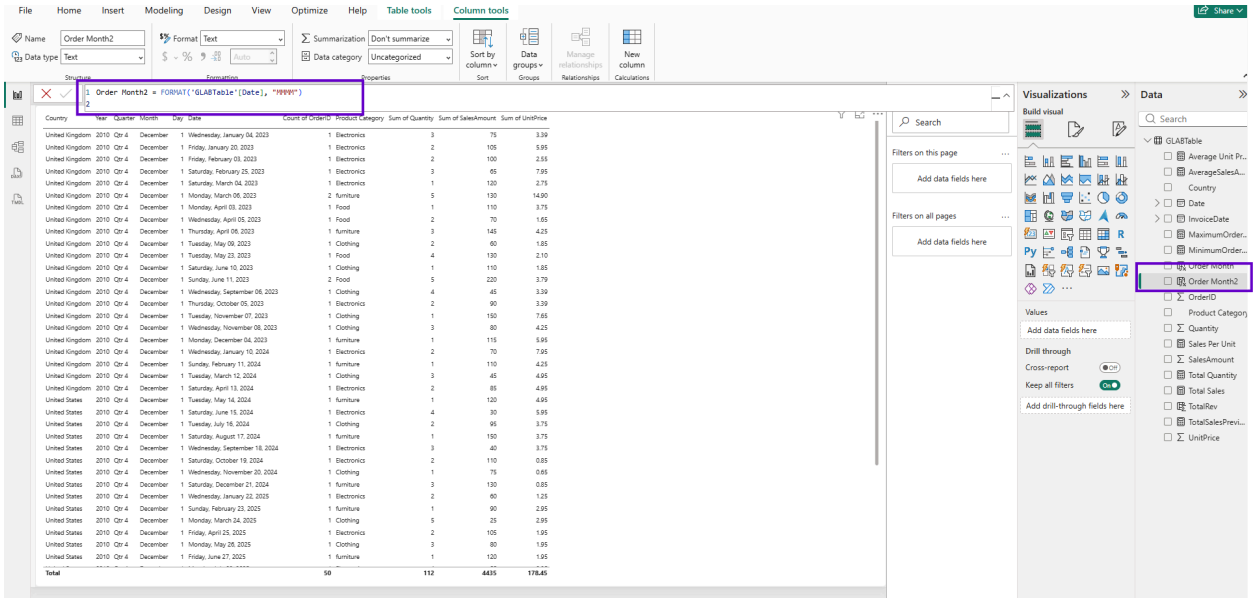

I used CALCULATE and SAMEPERIODLASTYEAR to compare sales with the same period from the previous year.

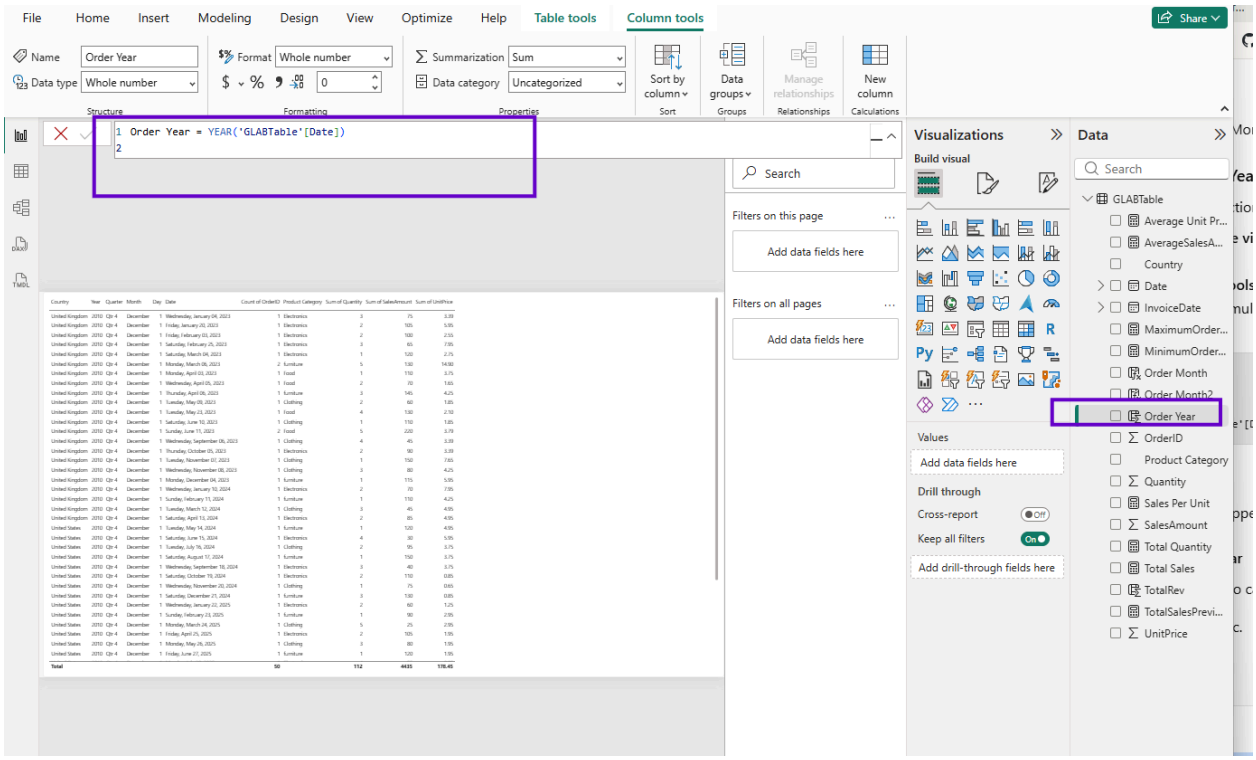

I used the FORMAT function to create a new column showing the month name for each order.

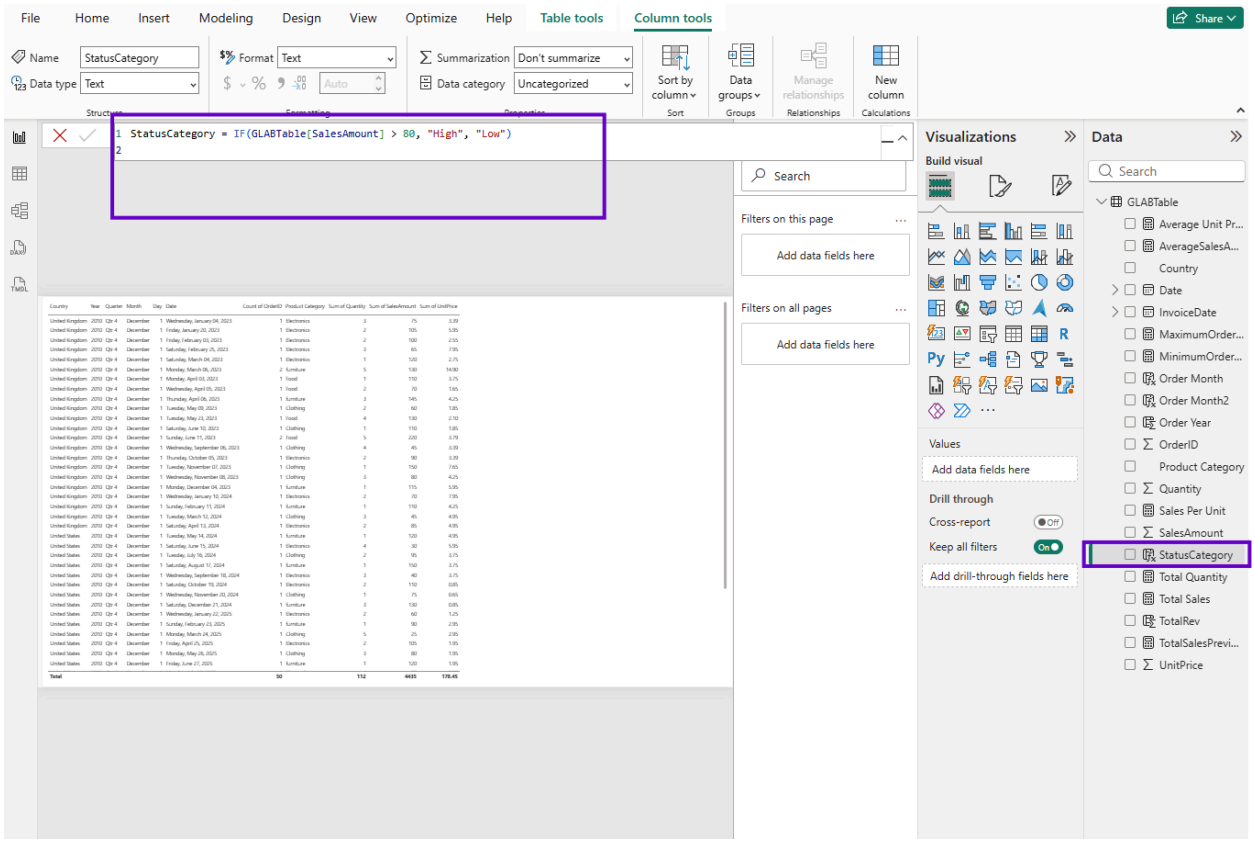

(have a column icon)

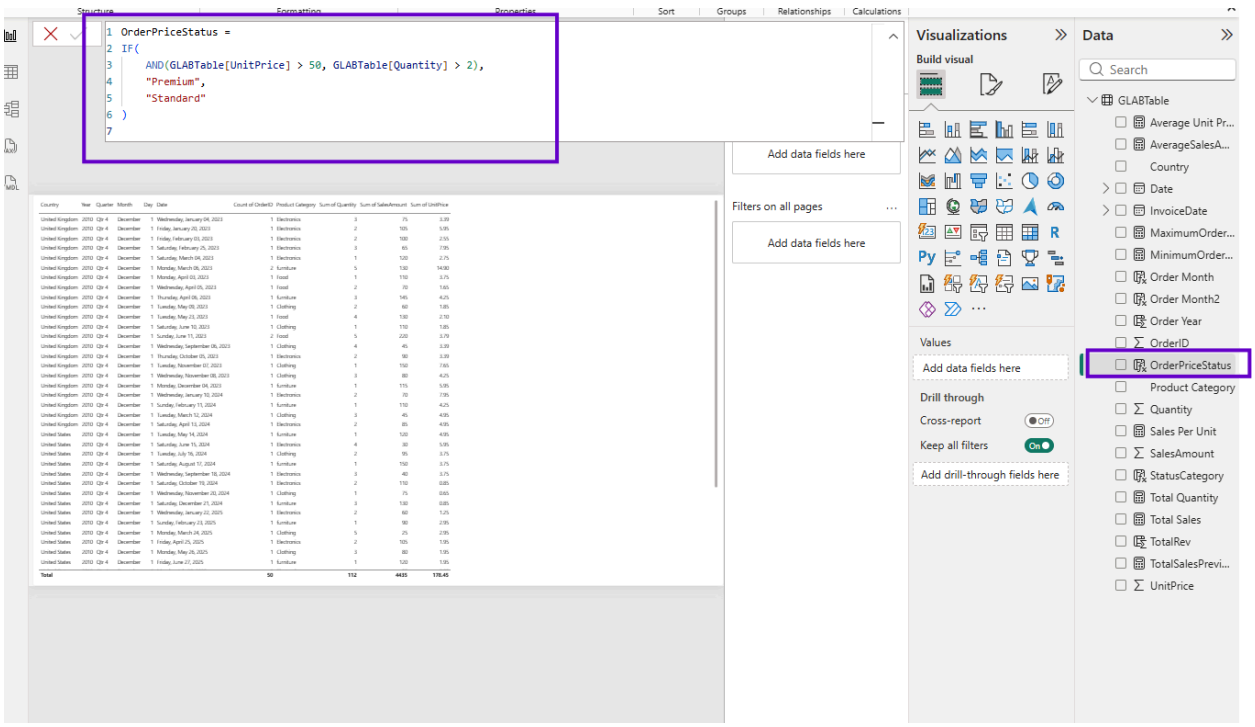

I used the YEAR function to extract the year from each order date.

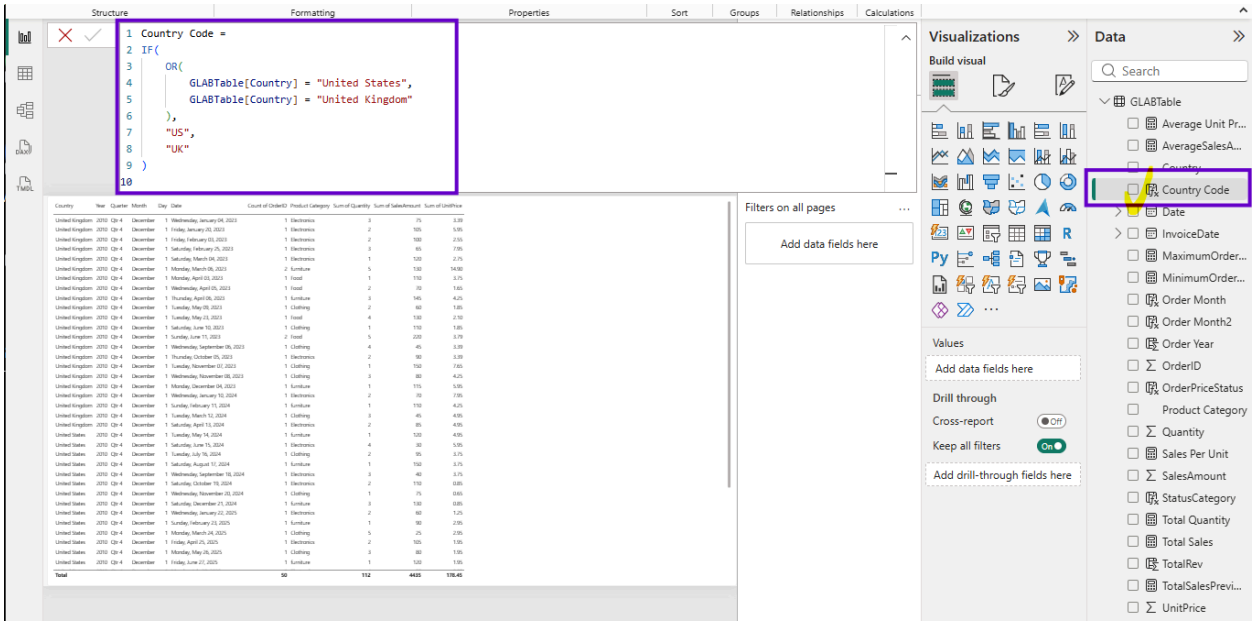

I used the IF function to label sales amounts above 80 as High and the rest as Low.

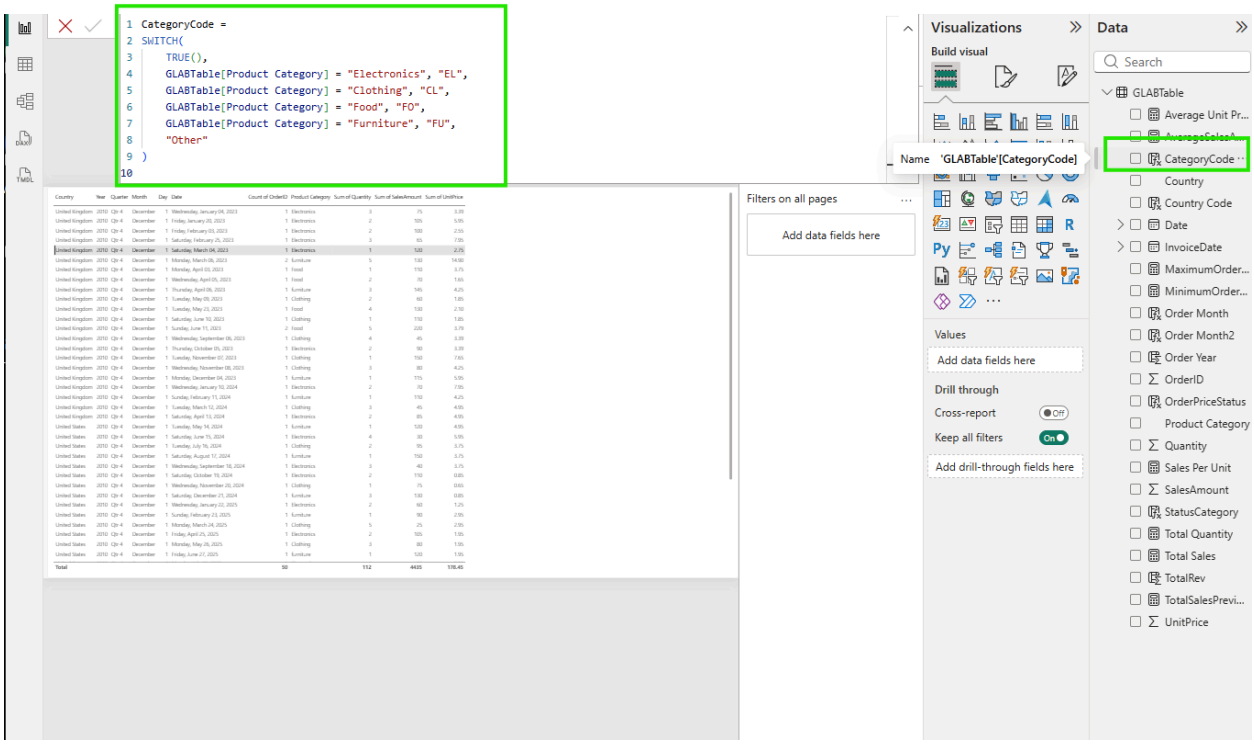

I used the AND function to label orders as Premium when the unit price is over 50 and the quantity is more than 2. Otherwise, they are Standard.

I used the OR function to check if the country is the United States or the United Kingdom and assign a country code.

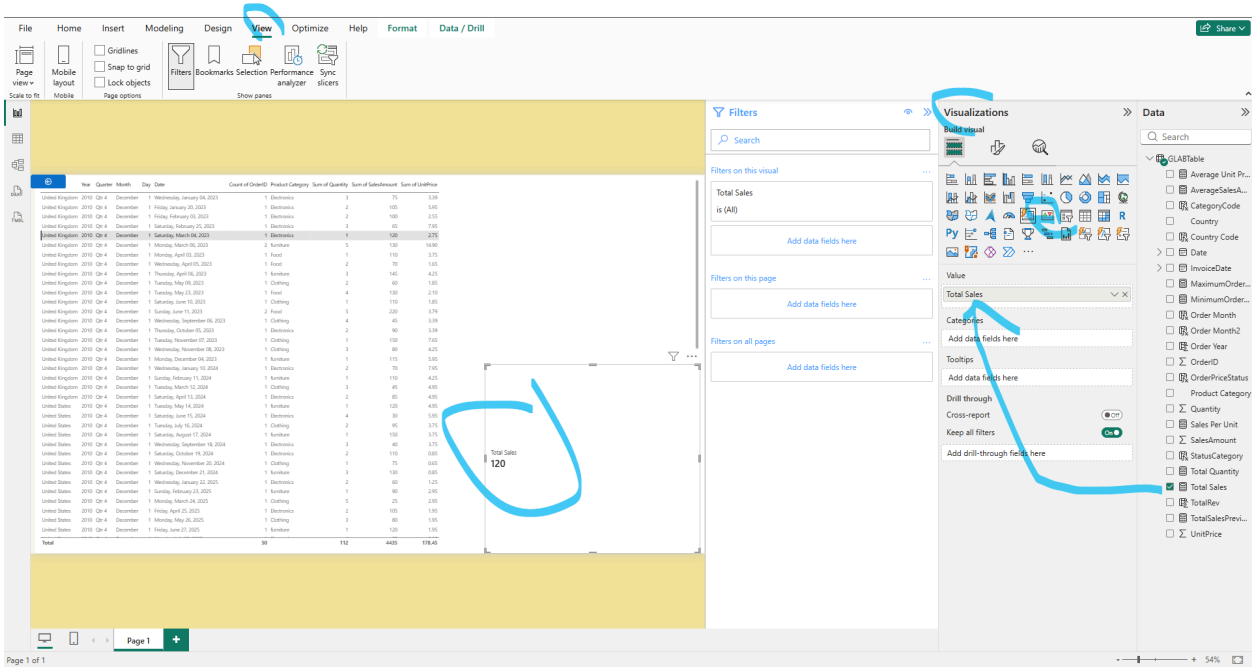

I used the SWITCH function to give each product category a shorter code, such as EL for Electronics and CL for Clothing.

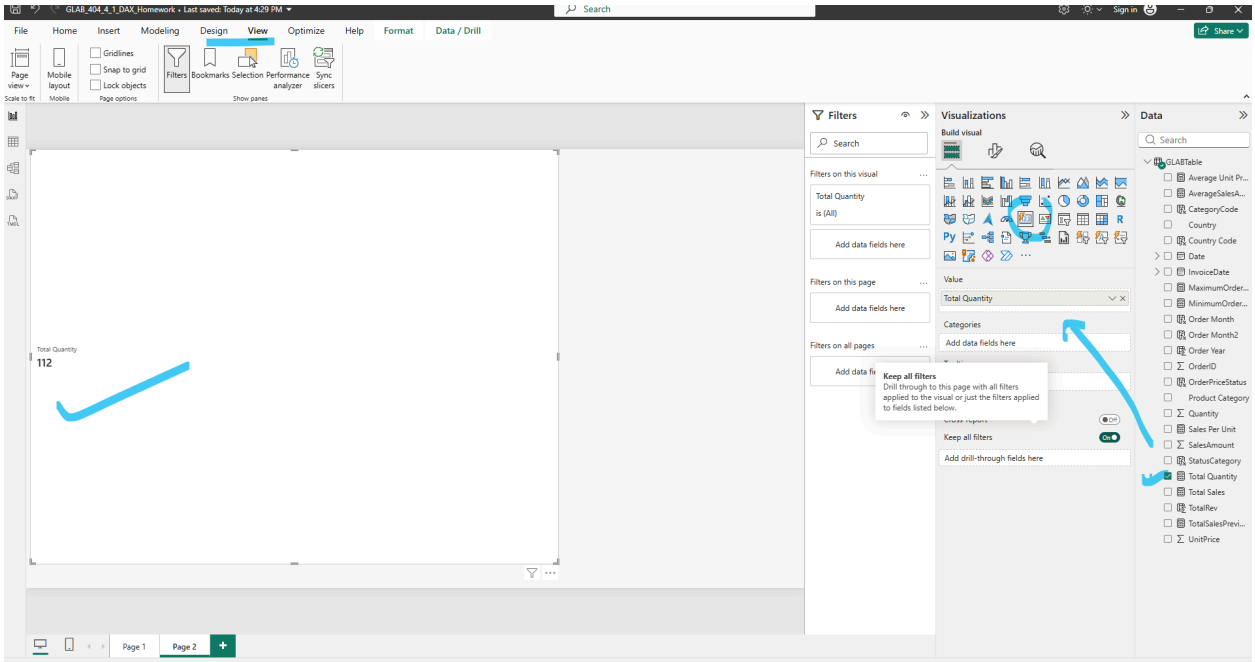

I saved my changes, from file → Save

I created a KPI card to show the total sales amount using the Total Sales measure.

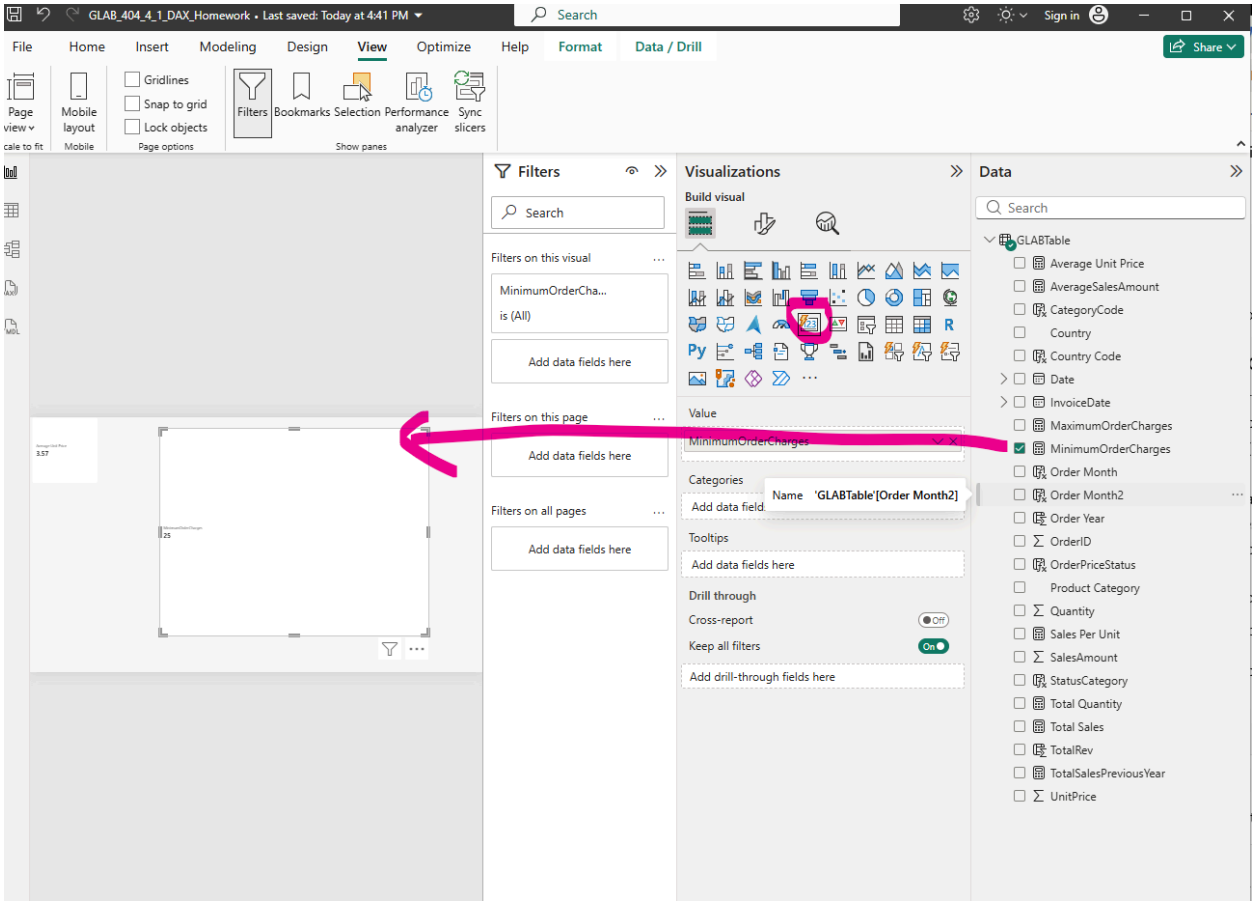

I created another KPI card to show the total quantity of products sold.

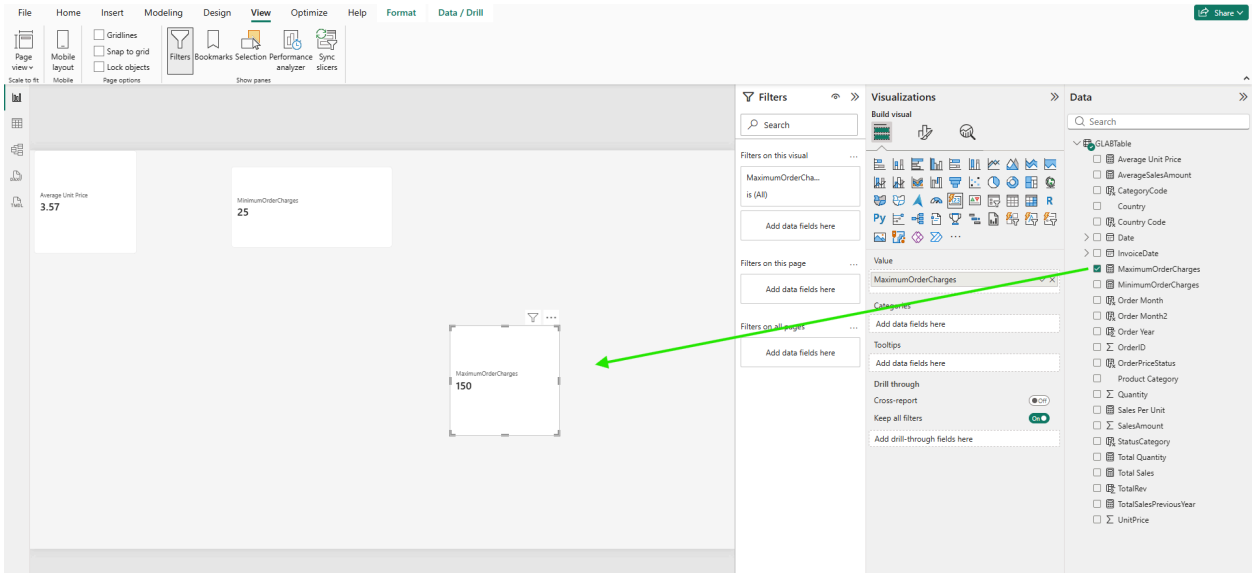

I created a KPI card to show the average unit price of the products.

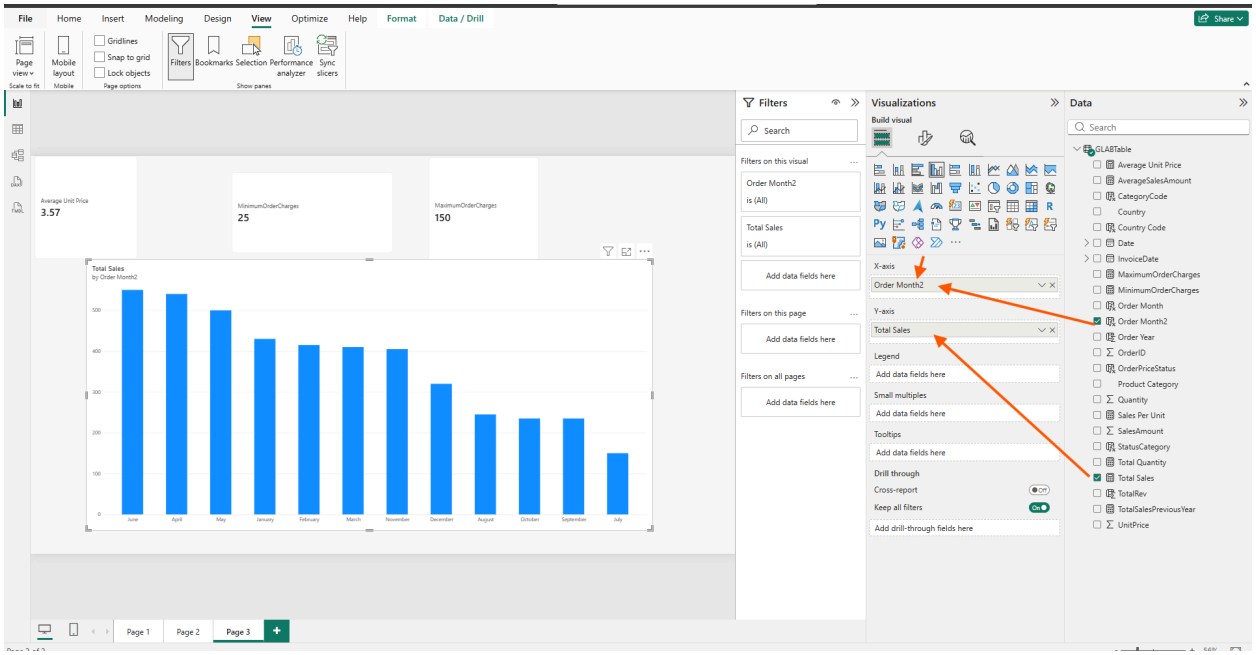

I created a KPI card to display the lowest sales amount in the dataset.

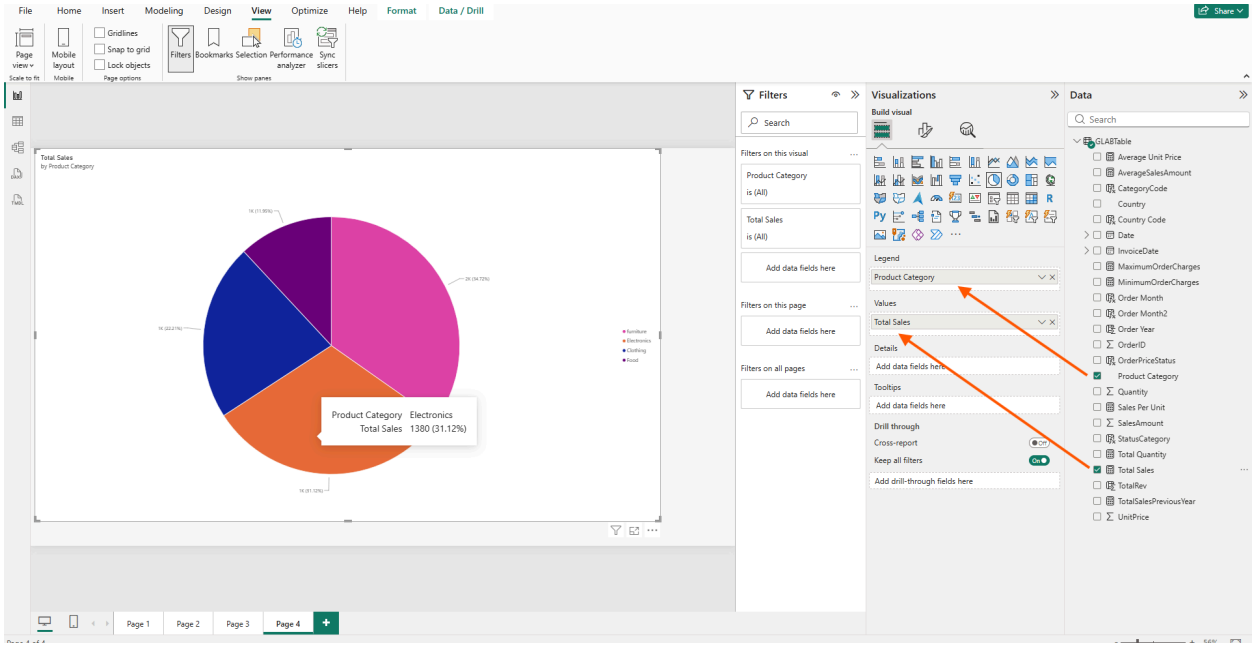

I created a KPI card to show the highest sales amount in the dataset.

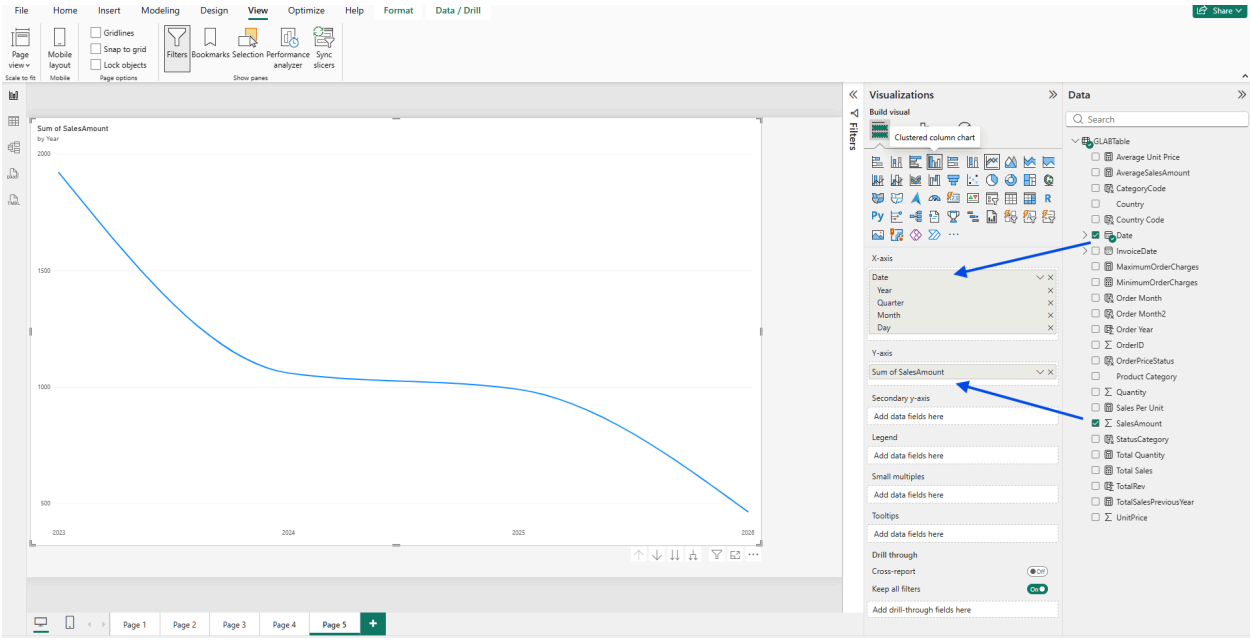

I created a column chart to compare total sales across different months.

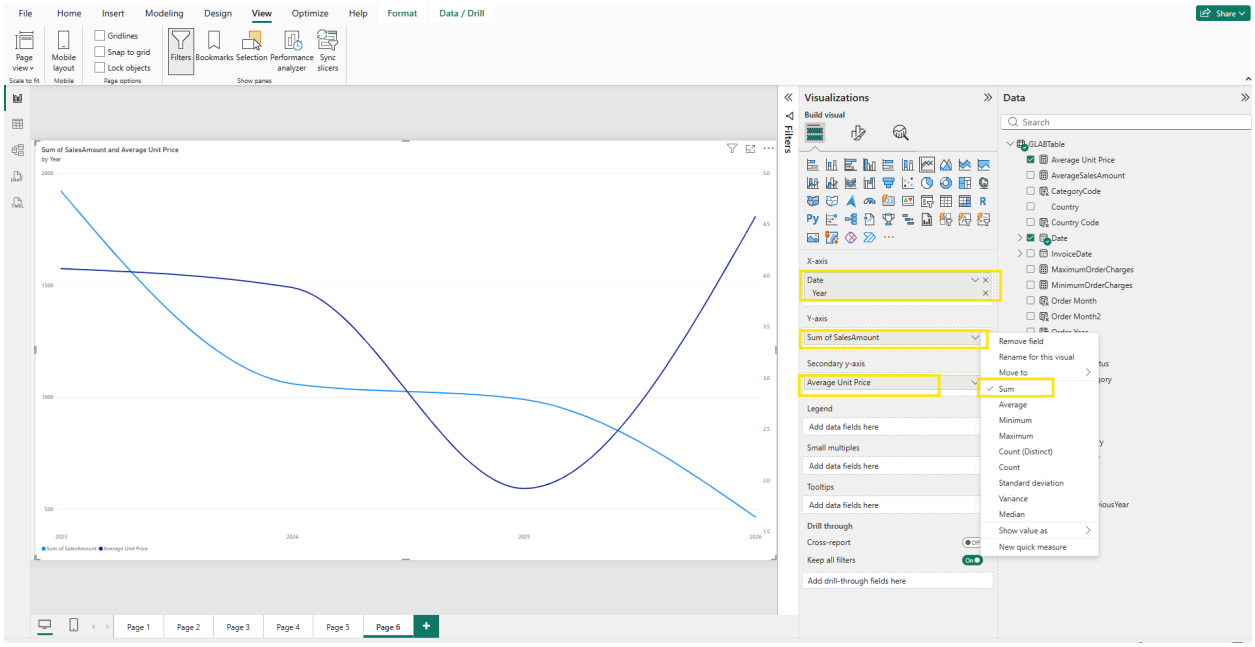

I created a pie chart to see how total sales are divided between different product categories.

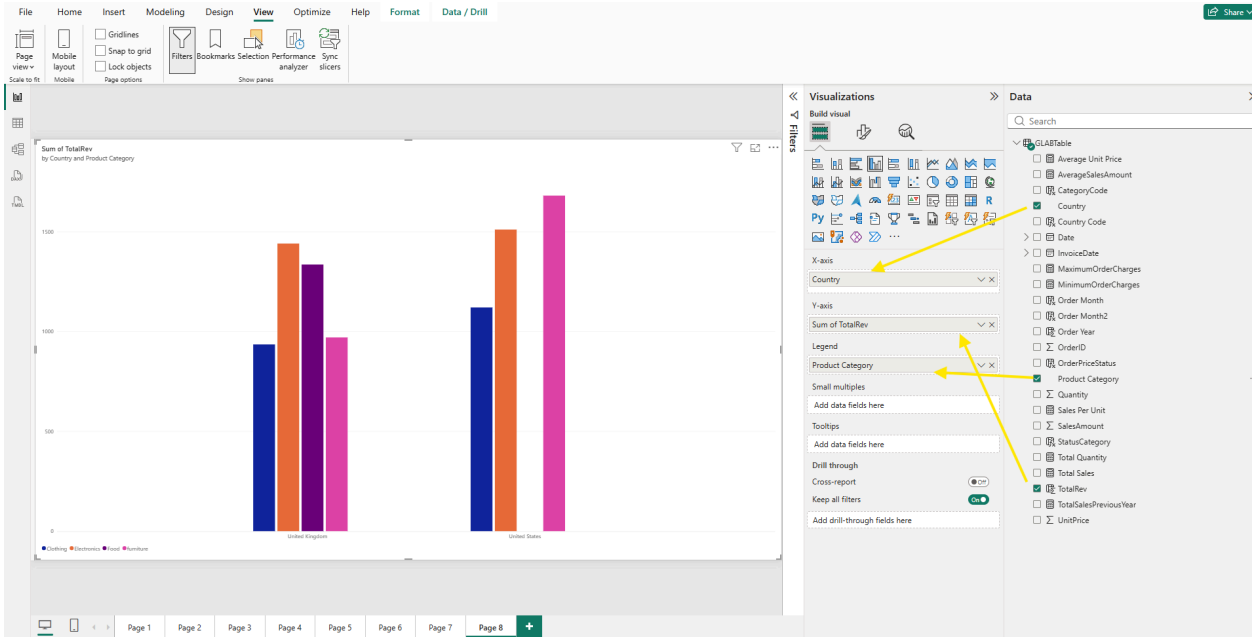

I created a line chart to compare sales amounts and average unit prices by year.

I created a line chart to compare total sales and average unit price by year.

I created a clustered column chart to compare total revenue by country and product category.

==========

I finished my Power BI dashboard using DAX formulas. I added cards and charts to make it easier to see and compare sales, prices, quantities, and revenue from different countries.
